

Interview Video Analysis Summary

Purpose: explain the interview video analysis module in simple terms for review, demo, and stakeholder sharing.

Generated: 2026-05-12T02:46:02.373Z

What the module does

- Accepts a completed interview video upload.
- Scans the video across the full interview duration.
- Generates a behavior risk report after analysis.
- Allows clicking report tiles to jump to the related video moment.

What is checked

- Eye movement away from camera, while ignoring short blinks.
- Long pauses before answering.
- Reading-like speaking patterns.
- Possible background or overlapping voices.
- Frequent screen or window switching.
- Lip-sync between mouth movement and audio.
- Changes in answer style or speech consistency.

How it works

- The system samples the video at evenly spaced timestamps.
- For each sample, it compares the current frame to the previous one.
- It separately inspects the mouth area and both eye regions.
- Audio is processed in small windows to detect pauses and overlap hints.
- Each check is converted into a percentage risk score.
- The final report shows overall risk plus detailed metric tiles.

Important notes

- This is heuristic analysis, not a face-recognition or ML-based judgment system.
- Accuracy improves when the interview video has stable framing and clear audio.
- The report is intended as a review aid, not a final disciplinary decision.
